Society
Energy

What is the adaptation and how does it address the hazard?

The adaptation is saving and conserving the energy. Reducing energy consumption assists our world to creating less of pollution.

Step 1

During a vulnerability / capacity assessment, we recognised the need to raise awareness of global warming among people, to spread awareness and comprehension so that everyone is aware of the issue and is motivated to contribute to its solution.

Step 2

Together with TRC: V-adapted (who recognize importance), we are trained to recognize problems and want to help. Hence, we have coordinated with schools and hospitals to go educate and raise awareness. Including making campaign banners and pasting them at various points, talking about simple methods that everyone can do for solving global warming problems.

Step 3

Transferring knowledge to people in schools and making campaign banners at various points are very useful for sharing knowledge, consciousness, and awareness to others. Consequently, they will truly understand the problem and want to solve it.
